

Indago

By Maddie Gee, Keith Lobo, Duncan Pringle, Dillon Blyth and Lois Coughlin

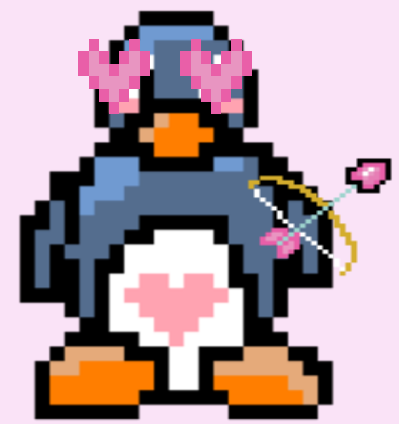

Struggling with motivation as a student?
Need more incentives to meet your goals?
Do you love animals?

Welcome to Indago!

It is no secret many students
experience procrastination, low motivation
and poor time management due to unstructured
workloads and competing priorities!

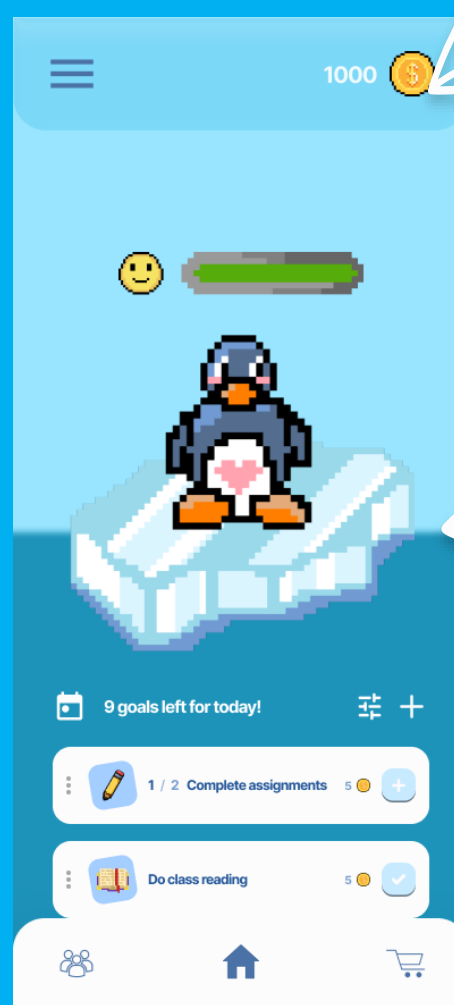

Prototype Demonstration

We will now give a quick
demonstration of the [prototype](#)!

Design System Choices

Why animals? We decided to use animals as we feel it is something lots of students will want to see thrive, people often have a strong affection for animals, so why not use that to help them?

Gamification: Coins and customisable accessories are used to gamify people's tasks and encourage them to earn their way to modifying their pet's appearance. This aims to help encourage people into enjoying their task and turn it into a habit.

Our prototype uses shades of blue and white to portray a calming theme that gets people into a relaxed mindset, ready to start working on their projects and assignments.

Design System Choices

Fonts: The title font seen on most pages is 'Urbanist', which we feel resonates with the brand identity as a rounded, not-too-formal font. We've used 'Inter' for the main body text of the prototype to give it a calm, humanist feeling (as described by Google Fonts).

Throughout the prototype, we've used rounded corners on most elements and buttons, giving a soft, playful look. We want the app to be easy on the eyes and not crowded with too many elements together, which can be overstimulating for some users.

Design System Choices

Contrasting Colours: In order to ensure that important features are highlighted, we've used brighter, more descriptive colours to have them stand out (in this case, red for the log out button).

Buttons have enough padding to make sure that users with disabilities that could make it difficult to tap smaller areas can easily click buttons.

Change Animal

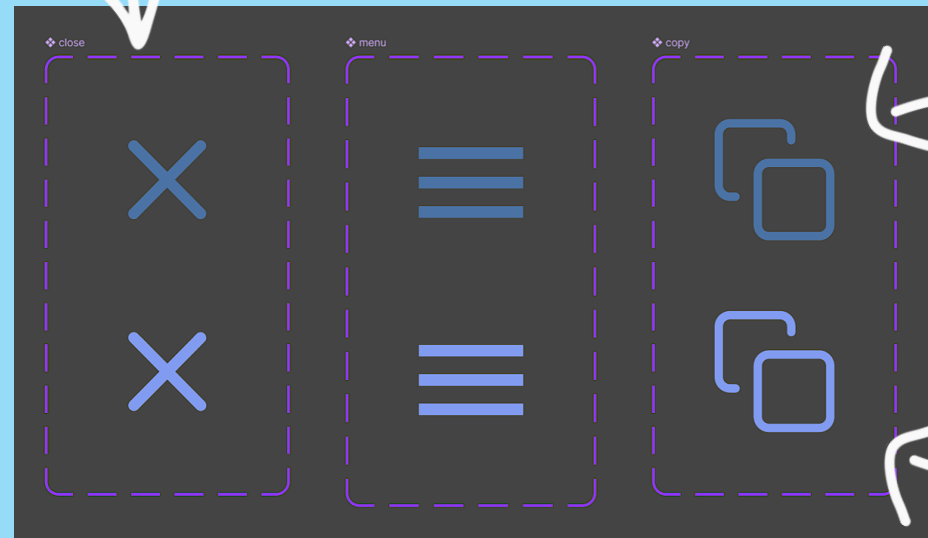

The pixel icons add an element of fun to the overall vibe of the app. Doing tasks can be fun!

Some buttons are playful, while also maintaining contrast with the background and enough padding to make sure clicking is accessible to all.

Figma Features Used

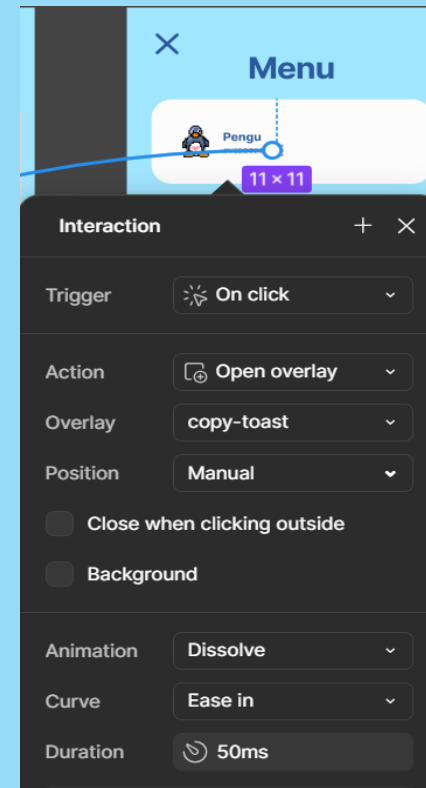

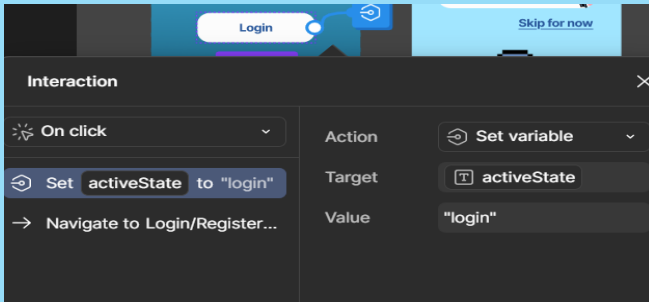

Assets were used to save time spent looking through different pages for unique assets

Used variants of buttons to create on-click animations (colour changes)

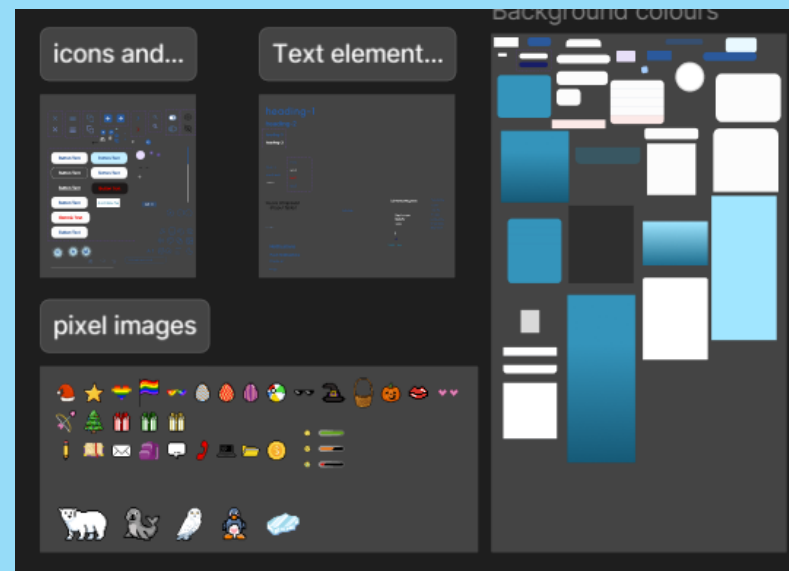

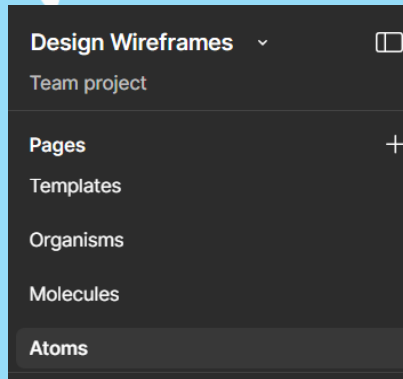

Figma Features Used

Interactions use different triggers and actions, with some changing variables to dynamically change pages and some overlays.

Figma Features Used

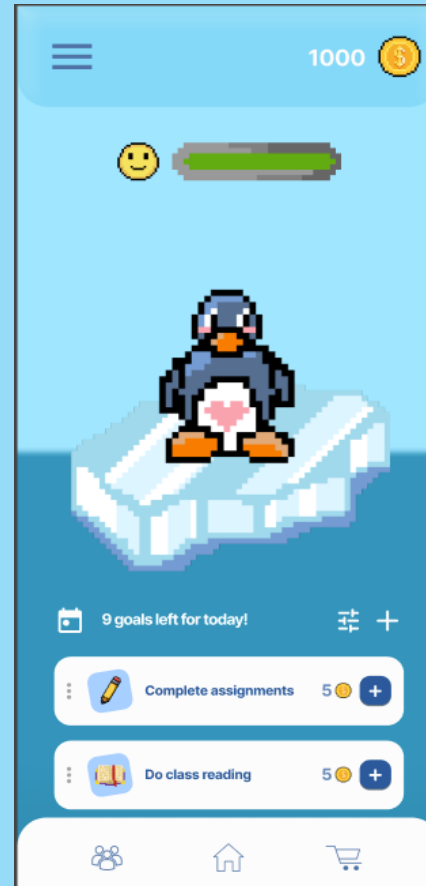

Each page was organised into sections to keep everything clear and useable

Different Pages were used to keep atomicity separate and simple

Figma Features Used

Annotation was used to keep communication easy, not always having to use a separate app

Used the scroll behaviour feature to give more emphasis on the elements that stay static on the screen.

Accessibility Decisions

Although our app is accessible already

We decided to make Indago as accessible as possible because we wanted to design a solution for EVERY student.

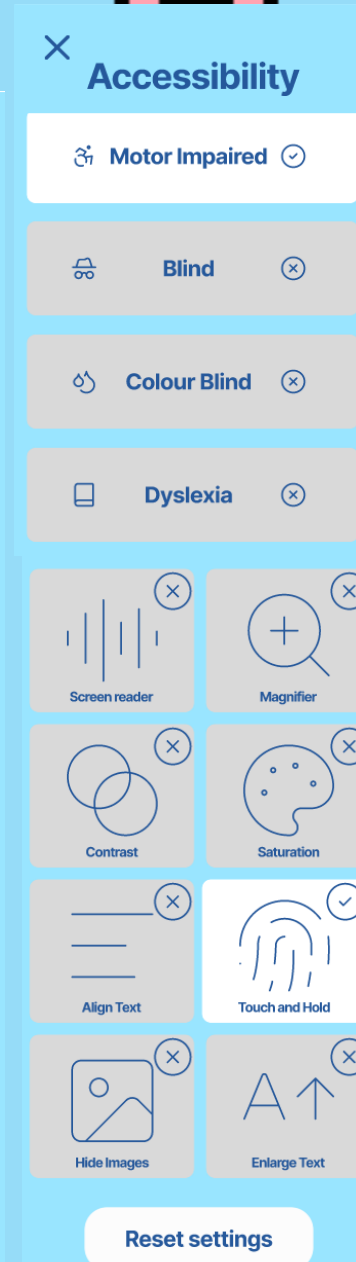

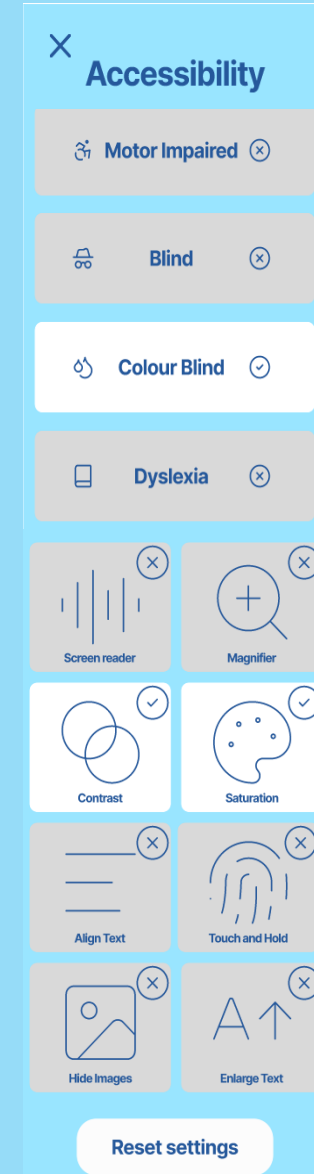

Indago contains many accessibility options including:

Motor impaired: Touch and Hold

Blind: Screen Reader, Hide Images

Colour Blind: Contrast, Saturation

Dyslexic: Align Text

Thank you!
